Description

The *Journal of Systems Architecture: Embedded Software Design (JSA)* is a journal covering all design and architectural aspects related to **embedded systems** and **software**. It ranges from the **microarchitecture** level via the **system software** level up to the **application-specific architecture** level. Aspects such as real-time systems, operating systems, programming languages, communications (limited to analysis and the software stack), mobile systems, parallel and distributed architectures as well as additional subjects in the computer and system architecture area will fall within the scope of this journal. Technology will not be a main focus, but its use and relevance to particular designs will be. Case studies are welcome but must contribute more than just a design for a particular piece of software.

Design automation of such systems including methodologies, techniques and tools for their design as well as novel designs of software components fall within the scope of this journal. Novel applications that use embedded systems are also central in this journal. While JSA does not focus on hardware design, hardware/software co-design techniques with an emphasis on software are also relevant here.

We invite you to convert your open source software into an additional journal publication in Software Impacts ↗, a multi-disciplinary open access journal. Software Impacts provides a scholarly reference to software that has been used to address a research challenge. The journal disseminates impactful and re-usable scientific software through Original Software Publications (OSP) ↗ which describe the application of the software to research and the published outputs.
